Windows: Connect to H: Drive Personal Network Storage

These instructions are for any Lehigh user needing to manually map their personal LAN drive (H-drive) on computers that are not in Active Directory (AD), such as personally-owned machines. These instructions may also be useful for users who are traveling or living off-campus and connecting to the Lehigh network via the Lehigh VPN. Click on the screen shots to see an enlarged view.

1. First, make sure you're connected to the Lehigh campus network, using either an Ethernet cable, Lehigh wireless, or over the internet using the VPN.

2. Right-Click on "This PC" icon and choose "Map Network Drive" from the contextual menu.

3. Select 'H:' from the "Drive" pull-down.

   If your H: designation has already been assigned, and you do not wish to overwrite it, simply pick any unused letter to map the storage drive.

4. In the "Folder:" box, enter the full UNC path to your personal LAN storage directory, according to the format shown, by substituting "<username>" with your Lehigh username (click on the screenshot to enlarge it):

   ```\homefs.cc.lehigh.edu\home\<username>```

   For example, if your username were "dhj210", you would type:

   ```\homefs.cc.lehigh.edu\home\dhj210```
5. If this computer is always connected to the Lehigh network, check the box for "Reconnect at sign-in".

6. Click Finish.

7. If you are prompted for a username and password, add the prefix "a" when entering your Lehigh username:

For example, your Lehigh username were "dab406", the username field should look like:

```
ad\dab406```

and then, enter your Lehigh password, and click "OK"
